DWARF SEMI / DRY SHELLING BEANS SEEDS

1. Coco Noir - Starazagorski

Black seeded variety which can be used for French style cutting and / or shelling of the semi-dry and dry seeds. The stringless, light green pods are 13 cm long, 18 mm wide and contain 4-5 large black coloured seeds when fully matured. Coco Noir – Starazagorski is well known for its tolerance to hot weather conditions.

2. Borlotto lingua di fuoco nano

The original 'fire tongue'-strain from Italy, with an outstanding uniformity. Borlottos' stringless pods are heavily marked with red stripes and easy to shell. Primarily used for shelling of the semi-dry seeds. Ready for harvesting as green pods after 55 days, or shelling semi-dry after 70-80 days.

3. Bagot

New ingot-type variety. The firm plants are upright, which make them suitable for mechanical harvesting. The seeds are long, straight and white. The variety is resistant to Bean Common Mosaic Virus, Halo Blight, and Anthracnose.

4. Big Baldoria

This variety with medium green / red striped stringless pods is primarily used for semi-dry and dry shelling. Ready for harvesting as green pods after 56 days, or shelling semi-dry 70-80 days. Resistant to Bean Common Mosaic Virus.
