**BECAUSE YOUR EGGS DESERVE THE STRONGEST SHELLS IN THE WORLD**

## ***DANISH & DUTCH OYSTER SHELLS***

Only in few places in the world has nature deposited so vast amounts of oyster shells that they may form the basis of industrial production. In Europe it is only In Denmark and the Netherlands that it has been possible to produce oyster shells for feed stuffs used in a vast number of countries all over the world.

Ten thousand years old, the oyster shells on the bottom of the fiords have proved to be the ideal calcium source: The calcium content is high and easily accessible, just as the flaky structure of the shells makes them unique, compared to limestone, mussel shells, and other types of calcium additions.
